Normalized Mark of j^{th} candidate in i^{th} session $\widehat{M}_{ij}$ is given by:

$$\widehat{M}_{ij} = \frac{\bar{M}_i^g - M_q^g}{\bar{M}_{ti} - M_{iq}} (M_{ij} - M_{iq}) + M_q^g$$

where,

M_{ij} is the actual marks obtained by the j^{th} candidate in i^{th}

$\bar{M}_i^g$ is the average marks of the top 0.1% of the candidates considering all sessions

M_q^g is the sum of mean and standard deviation marks of the candidates in the paper considering all sessions

$\bar{M}_{ti}$ is the average marks of the top 0.1% of the candidates in the i^{th} session

M_{iq} is the sum of the mean marks and standard deviation of the i^{th} session
